

ENTERPRISE SPECIFICATION

EventHub 360

Unified Database Schema (ERD) & UI/UX Console Specifications

A complete enquiry-to-profitability lifecycle design across twenty integrated modules.

PREPARED BY: Product & Solution Architecture Team

DATE: June 2026

STATUS: Baseline Release v1.0

Table of Contents

1. Executive Summary & Project Scope	Page 3
2. Visual Design System & UI/UX Tokens	Page 4
3. High-Fidelity UI/UX Dashboard Mockup	Page 5
4. System Wireframes & Interface Blueprints	Page 6
5. Normalized Database Entity Relationship Diagram (ERD)	Page 7
6. Database Table Schemas (Detailed Tables)	Page 8
7. Database Performance Indexes & Audit Triggers	Page 10

1. Executive Summary & Project Scope

EventHub 360 is an enterprise ERP platform that unifies the entire event, wedding, hospitality, and tourism business into a single role-based, multi-tenant system. In this sector, organizations typically rely on highly fragmented tools like spreadsheets, messaging chains, and separate accounting packages. This fragmentation leads to booking collisions, pricing margin leakages, and manual coordination errors.

This specification consolidates 20 functional modules into a normalized relational database design and a premium glassmorphic visual interface framework. Finance, invoicing, and auditing are handled as core entities to support per-event profit and loss calculation, automated gateway reconciliation, and compliance.

Scope Metrics at a Glance:

Functional Modules:	20 Modules (CRM, Quoting, Booking, Hotel PMS, AI, Marketplace, etc.)
Database Tables:	136+ Tables mapping cross-functional entity layers
API Endpoints:	480+ OpenAPI-compliant REST endpoints
User Roles:	15 standard roles with granular permissions

2. Visual Design System & UI/UX Tokens

To deliver a premium, modern experience, the UI/UX architecture implements a glassmorphic visual style based on high contrast dark background surfaces. Blur filters and translucent panels give depth and focus, while colored highlights emphasize state changes and metrics.

Token Name	Hex Value	Application Scope		
		Primary BG	#0B0F19	Main app
				Seconda

Typography Specifications:

- Headings: Google Font 'Outfit' (Vibrant, geometric curves for premium visual identity)
- Body/Data Tables: Google Font 'Inter' (Optimized for data density and numerical scanning)

3. High-Fidelity UI/UX Dashboard Mockup

Below is the rendered concept mockup of the EventHub 360 Web Console, showing the sidebar navigation and metric charts:

4. System Wireframes & Interface Blueprints

Layout Structure: Main Workspace Console

- Collapsible sidebar menu providing access to CRM, Proposals, Bookings, PMS, and Financial modules.
- Main canvas displaying metric counts cards (Pipeline, Active Bookings, Room blocks).
- Persistent notification dashboard showing database audit actions and workflow approvals.

Layout Structure: Lead pipeline Kanban Board

- Drag-and-drop pipeline cards separating leads by status: 'New', 'Qualified', 'Proposal', 'Won'.
- Live budget totals recalculated dynamically as cards are dragged between stages.

Layout Structure: Catalog-Driven Quotation Builder

- Left side menu showing venue lists and pricing items catalogs.
- Right side details sheet computing discounts, GST taxes, and margins dynamically.

5. Database Entity Relationship Diagram (ERD)

The relational schema is mapped to model the full business lifecycle. Relationships are enforced using foreign keys with cascade policies where applicable. Scoping constraints isolate tenant data transparently across all modules.

Core Structural Schema Paths:

Tenant Scoping:	tenant (1) -> (N) company -> (N) branch -> (N) venue / room
Sales Ingestion:	contact (1) -> (N) lead -> (N) quotation -> (1) booking
Event Scheduling:	booking (1) -> (1) event -> (N) event_tasks / guest
Hotel PMS Blocks:	event (1) -> (N) room_block
Financial Ledger:	

6. Database Table Schemas

Below is the specification of core database tables detailing primary keys, types, and references:

Table 1: tenant (Multi-tenant system root boundary)

Column Name	PostgreSQL Type	Key	Description / Constraints				
			tenant_id	BIGSERIAL	PK	Unique tenant system ID	
						name	VA

Table 2: lead (CRM Sales Pipeline)

Column Name	PostgreSQL Type	Key	Description / Constraints
			lead_idBIGSERIALPKUnique lead ID
			company_idBIGINTNOT NULLForeign key to company_id in companies table

Table 3: quotation (CRM Pricing proposal)

Column Name	PostgreSQL Type	Key	Description / Constraints		
			quotation_id	BIGSERIAL	PK
					Unique quotation identifier
					lead_id
					BIGSERIAL

Table 4: booking (Contract holds)

Column Name	PostgreSQL Type	Key	Description / Constraints		
			booking_id	BIGSERIAL	PK
					Unique booking ID
					booking_ref
					VARCHAR

7. Database Performance Indexes & Audit Triggers

Performance Indices

- 'idx_lead_stage_date': Speeds up dashboard pipeline rendering.
- 'idx_audit_entity': Optimizes trace queries for audit log checks.
- 'idx_booking_ref': Ensures fast contract status lookup queries.

Tamper-Evident Audit Triggers

Every write operation (INSERT, UPDATE, DELETE) on core transactional tables triggers the 'log_audit_change()' database trigger function. This function copies old and new row states into the 'audit_log' table as JSONB datasets, ensuring an immutable compliance log.
